

STUDIO 1500

OPERATION

Before applying power set the desired temperature on the setting dial.

Switch on the power – the 'kiln' and 'supply' lights will both come on.

The unit is now in the 'cut off' mode, the kiln will rise to the selected temperature and shut off, the kiln light will go out to indicate firing is complete. The temperature will then drop naturally.

If a new firing cycle is desired press the soak panel twice, first time selects 'soak' and allows the 'kiln' light to come on, second time returns to 'cut off' mode.

If a soak at the selected temperature is required press the 'soak' panel, the soak LED will light to show this mode is active. The kiln will now rise to the selected temperature and hold continuously. To shut the kiln down either; turn the power off or press the 'soak' panel again so that the controller is back in the 'cut off' mode.

In the event of short supply interruptions (up to approximately 30 seconds) the unit will return in the mode it was prior to the interruption.

For longer breaks the unit will fail safe and come on in the 'cut off' mode.
